Abstract

While walking the path through a fourth industrial revolution, the journey of transformation from the time when human intervention was needed, to the current state where the processes are completely automated and are still continuing to a new horizon. A game-changer adoption of the technology of "autonomic computing" supports industrial systems from deep inside and helps sustain with the ever-increasing complexity of systems, helps in customization to a greater extent, helps to manage the maintenance and reliability of the system that is beyond the limits of just human intervention. With this understanding, our work talks about important digital dimensions of smart manufacturing systems. It develops high-level awareness of technologies and ecosystems of smart manufacturing—Industry 4.0. Furthermore, readers would be able to identify tremendous opportunities for applications of computational intelligence referring to the capabilities and aspects of autonomic computing; those are self-healing, self-configuring, self-optimization, and self-protecting; thus pointers for innovation and applied research
